

## ABSTRACT

In a mobile device that includes two displays and is foldable, it is necessary to unfold a part having been folded before starting a call. In the case of a mobile device further including any imaging device, an image to be taken cannot be confirmed from a subject side. According to a mobile device of the invention, a display side housing is connected via a hinge to a body including an operation section to be foldable. The display side housing includes a lower housing connected to the hinge and an upper housing connected to the lower housing to be invertible. An imaging device is provided on either of faces of the lower housing, and a first display is on the other face. A second display is provided on either of faces of the upper housing. Any image to be taken can be displayed on both displays.
